All the cases presented in our catalogue and website belong to the patients whom have been treated by our professionals and used only by their authorization.

© DentGroup 2015
As DentGroup
WE are no ORDINARY DENTAL CLINIC
 WE, we represent the “new generation dentistry”
We’ve set out to become one of the most successful dental clinics in the world
Our primary goal is to make a difference in our patients’ lives and change the whole sector forever
We help kids, teens, adults and seniors smile to life with confidence, empowering them to change their world
EVERY SINGLE DAY, This is the mentality we come to work with.
BECAUSE we’re not only treating our patients’ teeth, we’re also touching their lives for the better.

This is exactly why we sit in our units with so much passion and motivation.
This is why we’re different, and, why we’re the changing face of our sector.

We know... how a tiny touch on a single tooth can lead to a huge smile and how a smile can unleash one’s full potential to change his or her life; be it a new job, a new girlfriend, a long deserved promotion or a role in a school play.

Our Mission
Our mission is to be one of the top dental clinics in the world, of which patients and employees enjoy being a part of the family, in which each patient is treated individually by our founder partners and lastly which has reached to international standards in terms of “brand equity.”
History

DentGroup was established in 2006 on Bağdat Caddesi by Dentist Efe Çelebi who is experienced in esthetic dentistry and by Orthodontist Cihan Çapan with ‘New Generation Dentistry’ in their minds.

DentGroup Göztepe was opened in 2007 after Dentist Bijen Muhit, who is also experienced in his profession, joined the team. Bijen Muhit started institutionalization and branching processes with Efe Çelebi and Cihan Çapan.

Then, DentGroup Kids was opened in Caddebostan in 2012 when Pedodontist Neşve Çetin Kayabapoğlu joined DentGroup family. DentGroup Kids started as “Happy Teeth Workshop” with the aim of helping our little patients aged between 0 and 12. later in February 2013, DentGroup A.Ş. (DentGroup Inc) has been officially established.

In May 2013, DentGroup Ataşehir, which would be a good example with its advanced technology and architecture in the sector, was opened under the same roof with DentGroup Kids when Dr. Tuğrul Saygı, who is specialized in maxillofacial prostheses and Esthetic Dentist Kerem Adalet joined DentGroup.

DentGroup Maslak is the first DentGroup Europe Branch was established in April 2014 by participation with Prostodontist Dr.Şirin Tuzcu. By June 2014 DentGroup Acarkent welcomed patients with participation of Dt.Pelin Cuhruk Karaer&Dt.Aydemir Karaer. In previous years, DentGroup’s fast&powerful growth strategy boosted by Pedodontist Zeynep Yalçınkaya Endemci, Dt.İnner Hocaoglu and Dt.Ekim Erkek Ertener While DentGroup is expending, it also aims becoming the most known Dentistry Clinic of the world with new participants & investors.
Dr. Tuğrul Saygı

Prosthodontics

Born in 1980 in Kahramanmaraş, Turkey, Tuğrul Saygı started studying in the Faculty of Dentistry in Ege University, in 1998. Upon completing his master’s and doctorate degree in the same university, he graduated in 2010.

Specialized in the Department of Prosthetic Dentistry, Mr Saygı completed his military service in 2011 as the reserve officer at GATA Haydarpaşa Eğitim Hastanesi (GATA Haydarpaşa Training Hospital), in Clinic of Prosthesis. Working at DentGroup Göztepe since 2010, Tuğrul Saygı is one of the founder partners of DentGroup Ataşehir, together with Kerem Adalet since 2013.

He carries his work at DentGroup Ataşehir. Particularly known for his snoring prosthesis and eye prosthesis, Dr Saygı has also published various reports and articles on prosthetic rehabilitations.

He is a member of Turkish Dentists Union (TDB), Turkish Prosthodontics and Implantology Association.

Dt. Kerem Adalet

Aesthetics Dentistry

Born in Adapazarı in 1982, Dt. Kerem Adalet graduated from Hüseyin Avni Sözen Anadolu Lisesi (“Hüseyin Avni Sözen Anatolian High School”), in 2001. He started his studies in 2004, in Faculty of Dentistry at Yeditepe University, and after having graduated, he completed his master’s degree in the Department of Dental Diseases and Treatment at the same institution.

As founder partner of DentGroup Ataşehir along with Dr. Tuğrul Saygı since 2013, Dr Kerem Adalet is working in DentGroup Ataşehir for procedures of tooth aesthetics and dental lamina, in addition to whitening.

He is a member of Turkish Dentists Union (TDB).
Dr. Şirin Baloğlu Tuzcu
Prosthodontics

Born in Aleppo in 1984, Dr. Şirin Baloğlu Tuzcu started studying in Faculty of Dentistry in Istanbul University in 2002 and she graduated in 2007. A year after her graduation, she began her specialty at the Department of Prosthetic Odontotherapy in the same faculty and graduated in 2013.

She worked for clinic of Dr. Gazanfer Gür in 2007 and then started working at Maslak Acıbadem Hospital in 2009. In July 2013, she joined the DentGroup family and started working at the branch of Göztepe. Since April 2014, she is a partner founder of DentGroup Maslak. She carries her work at Clinic of DentGroup in Maslak.

She is a member of Turkish Dentists Union (TDB), Turkish Prosthodontics and Implantology Association.
Technologic Substructure

3D Tomography
A visualization method enabling assessment of jaw bones in three-dimensional aspect.

Digital Anaesthesia
An anaesthetic machine, which gives opportunity to measure the tissue pressure digitally and applies the anaesthetic substance with automatic pressure. This means, the feeling of pain is minimised.

Picasso Dental Laser
This technology can be applied safely during soft tissue operations and it enables rapid post-operative healing process without pain.

Plasma Arc Bleaching
Regarded as one of the most successful light sources for teeth bleaching, plasma arc bleaching uses cold light source that activates the bleaching gels.

Velscope Cancer Preview Scan
By sending blue light beam at particular wavelength, this machine allows the detection of the mouth problems.

Dental Tourism
Established in 2006 with the motto of ‘New Generation Dentistry’, DentGroup is on its way towards becoming one of the most successful dental clinic in the World with the same high standards in each of our clinics. DentGroup is on its way towards becoming “One of the Most Successful Dental Clinic in the World”.

We provide high quality dental care and treatment for our patients from all around the World. We represent “New Generation Dentistry” with our clinics in Istanbul, Turkey. We offer top quality service with very affordable prices. We organize our patients’ arrival to the country and make their transportation among airports, hotels and our clinics smoothly.

First of all, patients contact us through our website or other web pages we are working with. They share their travel plans such as when they plan to travel, on which day they want to have their appointment and what treatment they would like to receive in our clinics.

Then, we create an individual treatment plan for them by consulting our dentists. We assist patients with economic flight plans and accommodation.

Once the treatment plan is set in motion and patients arrive at the airport, we welcome them with our VIP vehicle. We help the patients whenever transportation is necessary among our clinics, the airport and the hotel.

Happy Teeth Studio
What is Empress Crown?
It is a type of reinforced porcelain that contains no substructure material.

What are the advantages of Empress?
• It is the most aesthetic material used in dentistry.
• It provides a more natural look, since its light transmittance is much better, compared to other metal supported porcelains.

Why should we prefer Empress?
With its high light transmittance and natural look, it is used in order to design a beautiful smile.

How is it made, prepared and applied?
First of all, we take in-mouth and facial photos of our patients, who would like to have Empress. Dental impression is made, and with the help of this, we “design a smile” for the patient. By the help of a method so-called, mock up, we give a three dimensional demonstration of their look after the operation. All expectations of patient are taken into consideration during preparation of this demo. After selection of preferred demonstration, teeth are prepared by etching for 3 mm. Tooth impression, photos and acquired models of the patient are sent to the laboratory. Usually a 3-6 days interval is enough for empress to be prepared. We test the empress crown, and upon patient’s approval, it is cemented into mouth.

Can Empress fall out? Or can it be broken?
Empress crown that is bonded permanently to teeth cannot fall or be removed as a single piece. Due to their reinforced structure, they cannot be broken; however, in case of any damages, which are dangerous for natural teeth are even more so for Empress Crowns.

Can colour or shape of Empress change in time? Does it stink?
It preserves its colour and shape. Thanks to its polished surface, it does not cause dental plaque. It is a material which is compatible with the gingiva and does not stink.

What is Zirconia?
It is a white coloured substructure material used under the porcelain during bridge and crowning procedures.

What are the advantages of Zirconia?
• Crown and bridges supported with Zirconia are as strong as those supported with metal.
• On the contrary of metal-supported-porcelains, it has no grey reflection in the gingiva.
• It provides a more natural look, since its light transmittance is much better, compared to metal supported porcelains.
• It is anti-allergic.

When should you prefer Zirconia?
You can prefer Zirconia, if you miss a tooth (when bridge is necessary), in posterior region or when endurance is important.

How is it made, prepared and applied?
First of all, we take in-mouth and facial photos of our patients, who would like to have Zirconia. Dental impression is made, and with the help of this, we “design a smile” for the patient. By the help of a method so-called, mock up, we give a three dimensional demonstration of their look after the operation. All expectations of patient are taken into consideration during preparation of this demo. After selection of preferred demonstration, teeth are prepared by etching for 3 mm. Tooth impression, photos and acquired models of the patent are sent to the laboratory. Usually a 3-6 days interval is enough for zirconia to be prepared. We test the zirconia crown, and upon patient’s approval, it is cemented into mouth.

Can it be applied to those who have metal allergy?
Since there is no metal in zirconia crowning, it does not cause metal allergy.

Can it cause any change of taste or smell in the mouth?
As there is no metal in it, it causes neither taste nor smell.

Do the zirconia teeth change colour in time? Due to its smooth and slippery surface, it causes no dental plaque. That’s why, it cannot be affected by colorants such as coffee, tea and cigarette. Its colour is stable.

Aesthetics: Empress Crown

Aesthetics: Zirconia
Aesthetics: Tooth Bleaching

What is tooth bleaching? Tooth bleaching is a cosmetic solution offered to those who are not content with the colour of their teeth due to any reason. It is an oxygenation method used to bleach teeth that had undergone colour change due to various reasons or to bleach the natural tone of tooth.

Home Bleaching: In this method, called home bleaching, dental impressions of lower and upper jaws are made and they are sent to laboratory for preparation of transparent bleaching plaques. Patients apply a special bleaching agent in plaques as recommended by their doctors and then, place them in their mouth for recommended amount of period.

Office Bleaching: In this so-called office bleaching application, entire bleaching process takes place in clinic. Whole gingiva is covered with gingiva protector and bleaching gel is placed over teeth. We use laser or plasma light in order to activate bleaching gel.

Combined Bleaching: In this bleaching system, the bleaching procedure begins with office bleaching and continues at home with the plaques prepared for patients.

Aesthetics: Pink Aesthetic

What is pink aesthetic? Each tooth has its own gingiva attachment level and shape. The colour of healthy gingiva is pinkish; it is tightly bonded to the tooth and bone and it has a shiny, but gritty look, like orange peel. The perfect harmony of the gingiva with teeth is called “pink aesthetic”.

What are the kinds of pink aesthetic problems?
• If a person suffers from gingivitis due to poor mouth hygiene or periodontal problems, gingiva has dark reddish colour and often occurs with oedema. Even in some cases, gingivitis might affect the bone.
• If a person has an excessive display of gum tissue in upper jaw (gummy smile), which may result from excessive bulging protrusion of upper jaw; or his/her teeth are shorter than normal.
• Gingival recession might also be present, if patient has problems of grinding or clenching of teeth or brushing teeth hard; gingival recession can be seen.

What are the treatments of pink aesthetic?
• The treatment of swollen gingivae due to inflammation may vary from removal of calculus (tartar) to periodontal micro surgery. These micro surgeries can be held either by laser technology or by means of conventional surgery. In case, where gingivitis is accompanied by bone inflammation, bone meals or tissue stimulating proteins may be useful.
• In case, where the length of teeth is short or the gingiva is ptotic, the pink aesthetic may be used by an operation with laser. If the upper lip is very thin, little Botox touch-ups are recommended.
• Gingival recessions due to grinding or clenching of the teeth or hard brushing can be recovered by covering with gingival grafts.
• If there is an excessive bulging protrusion of the upper jaw, orthodontic treatment may be necessary.

Are the treatments painful? What are the things that should be taken into consideration?
The treatments are conducted with local anaesthesia and no pain is felt during the application. In the healing period, spicy, hot, sour foods or acidic drinks should be avoided.

Is control required after the treatment? Those, who suffer from gingival problems and who have undergone a treatment, should definitely abide by the control intervals recommended by their doctors.
According to 85% of the Americans, an attractive smile is very important for perception of that person during their first interactions with others.

BEAUTIFUL SMILE = POSITIVE PERCEPTION

According to result of a research conducted by Cosmetic Dentists Association in United States:

People who smile beautifully, receive much positive perception.

SUGGESTIONS FOR AN ATTRACTIVE SMILE

1. ORTHODONTICS
   Who can have orthodontics? It might be applied to almost all cases. Advantages:
   - Natural look, since it is the most aesthetic material.

2. EMPRESS
   Who can have empress? It can be applied to anyone. Advantages:
   - Natural look, since it is the most aesthetic material.

3. VENEER (COMPOSITE / PORCELAIN)
   Who can have veneer? It can be applied to anyone. Advantages:
   - Porcelain: Aesthetical look, permanent result, minimum erosion on teeth surface, no colour change due to external factors, preview of treatment results in 3D demonstration. Composite: It is completed in a short time, it has low-cost and can be applied at any age.

10 ADVANTAGES OF HAVING DECENT TEETH

1. BRUSHING IS MORE COMFORTABLE
2. PHONATION IS BETTER
3. CHEWING IS EASIER
4. REDUCED RISK OF TRAUMAS TO TEETH
5. LESS HEADACHES
6. BETTER GINGIVAL HEALTH
7. POSITIVE EFFECTS ON GENERAL HEALTH CONDITION
8. REDUCED DENTAL COSTS
9. LESS TRAUMA TO SOFT TISSUES
10. INCREASE IN SELF-CONFIDENCE
What is porcelain veneer?
Porcelain veneers are thin porcelain pieces having 0.3 – 0.5 mm of thickness, which are cemented only on the front sides of teeth.

Who can use porcelain veneer?
- Those who have decayed or fractured teeth due to trauma, on fore teeth,
- Those who have acid erosion (dental erosion) either due to brushing mistakes or dietary reasons, on the fore teeth,
- Those who want to have discoloured teeth,
- Those who are not satisfied with the length of their fore teeth,
- Those who suffer from a condition called diastema, where spaces are present between teeth,
- Those who have mild crowdedness and do not want to have orthodontic treatment.

How is it made, prepared and applied?
First of all, we take in-mouth and facial photos of our patients, who would like to have porcelain veneer. Dental impression is made, and with the help of this, we “design a smile” for the patient. Tooth impression, photos and acquired models of the patient are sent to the laboratory. Usually a 3-5 days interval is enough for porcelain veneer to be prepared. We test the porcelain veneer, and upon patient’s approval, it is cemented into mouth. The photos of the result are taken.

What are the advantages?
- For porcelain veneers, 0.3-0.5 mm of erosion on teeth surface is enough. Compared to other crowning systems, by this way, we prevent excessive losses of tooth tissue.
- By mock-up technique, the patient can see the results of his/her treatment in three-dimensional view before beginning the treatment.
- The colour does not change due to external factors (like tea, coffee, cigarettes)
- The results are permanent, as porcelain is a material that does not change colour or size wise.
- They look very aesthetic.

Aesthetics: Porcelain Veneer

Orthodontics: Invisalign / Incognito

Change your smile and your world with DentGroup orthodontics!
Besides traditional treatment methods like metal and porcelain dental braces, we also offer you alternative orthodontics treatments at DentGroup clinics!
DentGroup orthodontics offers Invisalign (orthodontics without braces) and Incognito (lingual orthodontics system), particularly, for businessmen, sportmen, diplomats, hosts, actors/actresses, models or those who do not want to wear dental braces.

Invisalign

Incognito
What is **All on Four** Implant Technique?

The Advantages
- Makes it possible to place stable dental prosthesis with just a single surgery on patients with total edentulism.
- The surgery is much easier since no further surgery methods as sinus swelling or bone addition is applied.
- The surgery time is shorter.
- Its cost is less than other treatments since less dental implants and no further surgery methods is used and applied.
- Provides esthetic smile and look.
- It is appropriate for patients that can’t use removable partial denture and have nausea reflex.
- Its cleaning process and maintenance is much easier than common treatments.
- Its design is different than dental plates, since it does not cover the whole plate of the patient, it is easier to adapt to and use it.
- Since necessary sessions amount is less, it is easier to be used by patients who live in different cities.

---

**What is implant?**
Implants are artificial tooth roots produced from titanium, which are placed in the jaw bone in order to support dental prosthesis in case of single and multiple missing of teeth.

**How implant is applied?**
Patient is examined clinically and radiographically. Following these examinations, which type, diameter and size will be used is decided and size of implant and later the material is determined. Treatment process may range between one day and six months.

**Is implant surgery difficult and painful?**
The procedure is thought to be very painful and difficult for the patent. However, dental implants are among one of the most effortless applications of dentistry. The application is done under local anaesthesia just like stopping or pulling tooth. After the anaesthesia is completed, the patient does not feel any discomfort. Approximately 15 minutes is enough for a single dental implant. Post-operative process is mostly non-problematic with the usage of pain killers for a couple of days and application of ice on the affected area. After the operation, the stitches are removed between 7-10 days.

**Dental implant?**
Anyone who does not have an important systemic disease and whose clinical and radiological examinations confirm to have adequate amount of bone tissue may have dental implant.

**Can a dental implant fall out?**
Along with the latest developments in medicine, the success rate of dental implants have almost reached 97%.
Treatment: Composite Veneer (Bonding)

What is composite veneer (Bonding)?
Bonding is a cosmetic approach that practically fix dental problems, such as fractured teeth, diastema (space between teeth), crowdedness, dental erosion, which make us unhappy. By the help of composite veneers, in just a single session, we can change form, size, colour and size of teeth as requested.

How is it applied?
Bonding may be applied without anaesthesia, in case that the decay is not deep, or fractured area is not large. If patient desires a change only in size and in form of teeth, then dental erosion is not required.

Composite based filling material is applied on the teeth with special dental adhesives and reinforced with light. Bonding is finished by tooth polishing.

What are the advantages?
• Since no further examination required, the treatment takes short time.
• The cost is lower compared to porcelain laminas.
• It can be used at any age.

What are the disadvantages?
• Colour change may occur in time.
• They are not as resistant to erosion as the porcelain laminas.
• They may require renewal since size, color and shapes change in time.

Prosthesis: Dental Prosthesis

What is complete denture?
Complete denture is a kind of prosthesis, which is used in case of total edentulism and which rest on upper and lower jaws. Complete denture is prepared approximately in five sessions, during which measurements and various rehearsals are made. Approximately two weeks are enough for five sessions.

What is hooked prosthesis?
It is applied, when stable prosthesis cannot be used. This prosthesis attaches to the tooth in front of the toothless part of mouth by means of its hook, and that’s why it has so named. This type of prosthesis has metal parts, which pass under the tongue in lower jaw and from the palate in upper jaw.

Prosthesis with gripper (sensitive attachment)?
This type of prosthesis is used, when there are plenty of teeth missing and when the treatment with stable prosthesis is not possible. They are widely known as “prosthesis with gripper” due to the hidden grippers placed in the holes prepared in the teeth. It can be considered as a combination of stable prosthesis and detachable prosthesis.
Prosthesis: Snoring Prosthesis

What is snoring and sleep apnea?
Snoring is defined as the loud voice during sleeping. According to definition in medical literature, tongue, uvula and soft palate, of particularly overweight adults, expands more than normal, and prolapses. These tissues lose their tightness and as a result, they narrow the respiratory tract. The vibration of these tissues due to air in lungs causes the snoring sound.

Accumulation of tissues, which completely lost their tightness, causes the blockage in the respiratory tract, and is called Sleep Apnea.

What are the effects of snoring and sleep apnea on people?
Difficulty in awakening, headache and nausea in the morning, somnolence during the day, falling asleep especially after lunch or dinner, lack of concentration and mood of constant tiredness and reluctance are among the most typical indications related to not breathing comfortably during sleep.

In addition to these symptoms, in advance phases of this disorder, due to very low oxygen level in blood, hypertension and cardiac dilatation may develop. Those who suffer from serious sleep apnea have the risk of heart attack or paralysis.

What are the treatments against snoring?
Currently, there are three treatments available for snoring:
• Surgical applications applied to soft palate and tongue by otolaryngologists, ENT surgeons, or
• CPAP mask, or
• Snoring prosthesis
Surgical interventions cannot be performed in every case. Moreover, there is a chance that disorder may develop again a while after operation. CPAP mask is used during night and since it blows air constantly, it prevents the blockage. The usage of the device is difficult, because patient has to sleep in supine position, noise of the machine might be irritating and it causes dry nose and also, it is an expensive treatment.

How does snoring prosthesis treatment work?
The snoring prosthesis, which is used during sleeping at night and is placed on teeth, it helps the tissues in the lower jaw, which have prolapsed down, to regain their previous tightness, and by this way it relieves the respiratory tract and thus, it prevents snoring or sleep apnea. The earlier the disorder is diagnosed, the shorter the treatment is.

What are the advantages?
• It is easy and comfortable to use.
• From the very first time that patient uses, it reduces or stops snoring or sleep apnea. Main effect is observed within 3-4 weeks.
• It fits in a small prosthesis box and can be carried anywhere easily.
• It does not require any surgical intervention.
• It is prepared specially for every patient.
• It is cheap compared to other treatments.

What is botox?
Used for therapeutic and cosmetic purposes in various cases both in medicine and dentistry, Botox blocks muscular contraction for a length of time. Its effect is to prevent the release of substance required for muscle contraction after nerve stimulation. Its effect lasts up to 6 months and it is recyclable; which means, it can be injected twice a year. It also serves as a pain killer. And in this effect, it might also be useful especially for those who suffer from arthralgia.

Botox is particularly used in the treatment of jaw or facial pain due to excessive contraction of masticatory muscles; defects in temporomandibular joint, bruxism, the straightening of facial mimic muscles cosmetically, correction of gummy smile (excessive appearance of gums while smiling), correction of facial asymmetries and wrinkles, preventing relapse due to the muscle contraction after orthodontic surgeries and for treatment of excessive sweating. It can also be used as adjuvant treatment for the pain related to arthralgia or bruxism.

Is the application painful? How is it applied?
It is not a painful method. Injection is made with an insulin injector and the whole procedure takes approximately 5-10 minutes. The effect can be seen from the 3rd day. It reaches its highest level dating from the 2nd week.

Who cannot have Botox application?
Since there is not enough research made on this issue, pregnant and breastfeeding women should avoid this procedure. Additionally, allergic anamnesis can be expected. For patients with allergy, before the procedure is held, Botox should be tested on another part of body.

What are the post treatment instructions after botox?
Patients should not rub or massage the treated area nor expose it to direct sunlight. In addition, applying ice is recommended to prevent bruises.

Before

Botox

After

Used by authorizaton of our patients
As DentGroup Kids, we are not just an ordinary oral and dental health clinic. In some way, one clinic resembles another. However, we do not only insist on our difference, but we also refuse to be one of them.

We are the Happy Teeth Workshop

All details in our clinics are designed in order to put a big and healthy smile on the faces of our little friends. Because we know that if a child smiles, first of all his/her world changes, so does ours.

While turning our little patients’ treatments into something more entertaining, we try to get them adopt healthy habits. We are always together with patients from their milk teeth to baby bottle tooth decays or from their molar tooth to their dental braces.

At DentGroup Kids, we do not only take care of the teeth of children, but we know how to get along with them.

From the beginning, our aim is to be the most successful paediatric dental clinic, both in Turkey and around the world.

Because we are not only responsible for our little ones’ teeth, we are conscious that our treatments may result in a smile and help them reveal the future doctor, astronaut, actor, teacher or pop star.

That is why we are different from the other clinics. Because we are not only responsible for our little ones’ teeth, but also for their smiles and bright futures.
Team of DentGroup

Our patients receive highest quality of service from our young, dynamic, sincere, diligent and passionate doctors, who are extremely experienced in their fields.
Established in 2006 with the motto of ‘New Generation Dentistry’, DentGroup is on its way towards becoming one of the most successful dental clinic in the world with the same high standards in each of our clinics.
